Companion to Status Report V6.0

INTELLIGENCE, ENGINEERED.

Roadmap Overview

This document outlines suggested improvements and new features for the Bloomin' Acres website, organized by priority. Each item includes the expected impact on customer experience, business value, and estimated scope. These recommendations are based on our V6.0 status report findings and are designed to address three key areas: **visual design polish**, **mobile experience**, and **customer journey optimization**.

8.6 ↑	9.2
CURRENT SCORE	TARGET SCORE

Focus Areas

AREA	CURRENT	TARGET	KEY IMPROVEMENTS
Visual Design	7 / 10	9 / 10	Micro-interactions, depth, textures, photo quality
User Journey	8.5 / 10	9 / 10	Pickup slots, email notifications, about page, reviews
Mobile	8.5 / 10	9 / 10	Touch-optimized cart, mobile nav polish, responsive images

Priority Tiers

TIER	DESCRIPTION	ITEMS
HIGH	Directly improves conversion, customer experience, or retention	7 items
MEDIUM	Adds value, improves polish, supports growth	6 items
LOW	Nice-to-have, future enhancements	4 items

Visual Design Improvements

Current: 7/10 → Target: 9/10

The site has strong structural design and good typography. These improvements add depth, warmth, and artisanal character that match the Bloomin' Acres brand.

1. Product Page Visual Enrichment

HIGH

The product detail page is clean but minimal. Add subtle background textures, ingredient/attribute tags with soft styling (organic, handmade, seasonal), and a "From Farm to Table" visual element. Consider an image gallery carousel for products with multiple photos.

Benefit: Richer product pages increase dwell time and purchase confidence.

2. Micro-Interactions on Buttons & Cards

HIGH

Add subtle hover transitions to all interactive elements: cart buttons fill with color on hover, favorite hearts pulse on click, menu item cards lift with a warm shadow, and toast notifications slide in smoothly. Small details that make the site feel alive.

Benefit: Tactile feedback builds trust and makes the shopping experience feel polished.

3. Enhanced Image Treatments

MEDIUM

Add warm-toned overlays using the brand palette (wheat, sage, cream) on card images and hero sections. Replace generic gradient overlays with brand-colored duotone effects. Consider subtle vignette on product photos for an artisanal feel.

Benefit: Consistent, warm image treatment reinforces the farmstead brand across all pages.

4. Landing Page Depth & Layering

MEDIUM

Increase visibility of decorative botanical elements (currently very low opacity). Add a subtle parallax effect to the hero section. Introduce a layering system with elevated card surfaces and floating elements to create visual depth.

Benefit: Visual depth makes the page feel crafted rather than template-based.

5. Professional Product Photography Guide

MEDIUM

Provide a simple photo guide for consistent product shots: natural lighting, rustic wood/linen backgrounds, consistent angles, minimum resolution. Good photos are the single biggest factor in food e-commerce conversion.

Benefit: Consistent, appetizing photos increase add-to-cart rates. No code changes needed.

6. Seasonal Theme Variations

LOW

Create subtle seasonal variations of the color palette and decorative elements. Warmer tones for fall, lighter greens for spring. Toggle-able from admin dashboard without code changes.

Benefit: Keeps the site feeling fresh and current for repeat visitors.

Mobile Experience

Current: 8.5/10 → Target: 9/10

Most customers will browse and order from their phones -- especially at farmers markets or while planning their week. These improvements make mobile the primary experience rather than an afterthought.

1. Mobile-Optimized Cart & Checkout

HIGH

Redesign the slide-out cart panel for mobile: full-width on small screens, larger touch targets for quantity controls, swipe-to-remove items, and a sticky checkout button. Guest checkout modal should be a full-screen sheet on mobile instead of a centered popup.

Benefit: Frictionless mobile checkout directly increases conversion from phone users.

2. Touch-Friendly Menu Interactions

HIGH

Increase tap target sizes on menu item action buttons (View, Options, Cart). Add a sticky category nav at top of menu page so users can jump between sections without scrolling. Variation dropdowns should use native mobile selectors.

Benefit: Faster product browsing on phone reduces drop-off.

3. Responsive Image Optimization

HIGH

Serve different image sizes based on device: use `srcset` and `sizes` attributes to send smaller images to mobile devices. The menu header image and landing page hero are especially heavy on mobile. Implement lazy loading for below-the-fold images.

Benefit: Faster page loads on mobile networks. Reduces data usage for customers.

4. Mobile Navigation Refinement

MEDIUM

Add haptic-style visual feedback when sidebar opens. Improve the account submenu with better spacing and clearer visual grouping. Consider a bottom nav bar for the most common actions (Home, Menu, Cart, Account) to match mobile app conventions.

Benefit: Familiar mobile navigation patterns reduce learning curve for new visitors.

5. PWA / Add to Home Screen

MEDIUM

Add a web app manifest and service worker for "Add to Home Screen" capability. Regular customers can pin Bloomin' Acres to their phone's home screen for app-like access. Enables offline caching of the menu for areas with poor reception.

Benefit: Home screen presence increases repeat visits. Offline menu is useful at farmers markets.

6. Mobile-Specific Gestures

LOW

Add swipe gestures: swipe between product images in gallery, swipe to dismiss cart panel, pull-to-refresh on menu page. Small touches that make the site feel native on mobile.

Benefit: Native-feeling interactions increase user satisfaction on mobile.

User Journey Enhancements

Current: 8.5/10 → Target: 9/10

The guest checkout implementation significantly improved the purchase flow. These next steps focus on the full customer lifecycle -- from first visit to loyal repeat buyer.

1. Pickup Time Slots

HIGH

Add a pickup window selector at checkout (e.g., "Tuesday 9-11am", "Friday 2-4pm"). Admin sets available time slots per day from the dashboard. Reduces crowding at the farmstand and gives customers certainty about when their order is ready.

Benefit: Directly improves the post-purchase experience. Reduces "when can I pick this up?" questions.

2. Email Notifications

HIGH

Automated emails for: order confirmation with pickup details, "order ready for pickup" notification, and weekly menu announcement when a new menu is published. Use a transactional email service (e.g., Resend or Supabase Edge Functions + SMTP).

Benefit: Keeps customers informed without manual effort. Weekly menu emails drive repeat orders.

3. About Page

HIGH

Dedicated page with the farm story, family photos, growing philosophy, and mission statement. Customers buying artisan food want to know the people behind it. Can include a photo gallery and seasonal farm updates.

Benefit: Emotional connection drives loyalty. Critical for differentiating from generic online stores.

4. Discount / Promo Codes

MEDIUM

Integrate Stripe Coupons for promotional pricing. Use cases: first-time buyer discount, seasonal sale events, referral rewards, social media promotions. Add a "Promo Code" field to the checkout flow.

Benefit: Drives first purchases and enables targeted marketing campaigns.

5. Product Reviews

MEDIUM

Star ratings and short text reviews on product pages. Only verified purchasers can leave reviews. Display average rating on menu cards. Admin can moderate reviews from dashboard.

Benefit: Social proof builds trust for new customers. Helps surface best products.

6. Order-Ahead / Pre-Order

LOW

Accept orders for items baked on specific days. Customers can reserve a sourdough loaf for Saturday's batch, for example. Admin sets bake schedules; pre-orders close at a configurable cutoff time.

Benefit: Reduces waste by matching production to demand. Guarantees customers get what they want.

E-Commerce & Operations

Business Operations

1. Inventory Alerts

MEDIUM

Notify admin when stock falls below a configurable threshold. Email or dashboard notification. Prevents overselling and ensures the menu reflects actual availability.

Benefit: Reduces customer disappointment from out-of-stock items at checkout.

2. Sales Export & Reporting

MEDIUM

CSV export of orders and revenue data for bookkeeping and tax preparation. Filter by date range, product, or customer. Simplifies end-of-month reconciliation.

Benefit: Saves hours of manual bookkeeping. Essential as order volume grows.

3. Google Business Profile Integration

LOW

Link website to Google Business Profile for local search visibility. Display Google reviews on the landing page to build trust with new visitors searching for local bakeries.

Benefit: Improves local SEO and builds trust through third-party reviews.

4. Blog / Recipes Section

LOW

Simple blog for sourdough tips, farm updates, and recipes. Admin-editable from the dashboard. Drives organic search traffic and gives customers a reason to visit between orders.

Benefit: Long-term SEO investment. Builds community and positions Bloomin' Acres as an authority.

Implementation Summary

FEATURE	PRIORITY	CATEGORY	SCOPE
Product page enrichment	HIGH	Visual	Small
Micro-interactions	HIGH	Visual	Small
Mobile cart & checkout	HIGH	Mobile	Medium
Touch-friendly menu	HIGH	Mobile	Small
